#### **DETAILED ACTION**

## Specification

- 1. The disclosure is objected to because of the following informalities:
- Pg. 1, line 27, applicant uses the phrase "and each base stations is". a. Examiner suggests using "and each base station is" for clarification purposes.
- Pg. 2, lines 1-2, applicant uses the phrase "antenna 100 receives high b. frequency signal". Examiner suggests using "antenna 100 receives a high frequency signal" for clarification purposes.
- Pg. 3, line 7, applicant uses the phrase "matched life". Examiner assumes C. applicant means "matched filter".

Appropriate correction is required.

2. The specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

## Claim Objections

- 3. Claim 3 is objected to because of the following informalities:
- Claim 3, line 1, applicant uses the phrase "coherent combing". Examiner suggests applicant uses "coherent combining" for clarification purposes. Appropriate correction is required.

Art Unit: 2634

# Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims 1-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over Higuchi et al. (6,167,037) in view of Masui et al. (US Patent 6,269,088).
- (1) With regard to claim 1, Higuchi et al. discloses a signal transmitting method comprising an apparatus for acquisition of a direct-sequence/code division multiple access signal, which acquires a long code from a direct-sequence/code division multiple access control channel signal, in which a common short code, and the long code are transmitted within one frame, and a group identification code indicating a code group, to which a base station belongs, are combined and transmitted with the common short code comprising: a long code masking correlation portion for correlating common short codes generated internally and the control channel signal; a differentially coherent combining portion for deciding whether acquisition of the common short code is achieved or not by multiplying a complex conjugate value of previous output of the long code masking correlation portion (Fig. 5 (12)) by present output of the long code masking correlation portion and by accumulating the results of multiplication during the predetermined times, and a code group and frame timing acquisition portion for acquiring the code group and frame timing by correlating each group identification code, which can be generated according to the coherence of the common short code, and the

Art Unit: 2634

received group identification codes respectively, and by combining each correlation result; and a long code acquisition portion for acquiring the long code by correlating the long codes belonging to the acquired code group and the received long code respectively (abstract, col. 1, lines 26-31, col. 4, lines 1-17, col. 10, lines 19-26, col. 11, lines 34, 36, col. 14, lines 41-64, 15-31, col. 17, lines 23-60, col. 19, lines 15-38).

However Higuchi et al. does not disclose taking an absolute value of the accumulated value.

However Masui et al. discloses a CDMA mobile communication system taking an absolute value of the accumulated value (Fig. 8A, Fig. 9 (81), col. 8, lines 58-67, col. 9, lines 1-42, col. 10, lines 10-11).

Therefore it would have been obvious to one of ordinary skill in the art to modify the invention of Higuchi et al. to incorporate taking an absolute value of the accumulated value to employ a reservation based access control to realize a high throughput and solve the problem of collision of reservation packets.

- (2) With regard to claim 2, claim 2 inherits all the limitations of claim 1. Higuchi et al. further discloses in (Fig. 5) wherein the long code masking correlation portion (12) is a matched filter correlator comprising a plurality of taps whose tap coefficients are the common short codes generated internally (col. 10, lines 27-66).
- (3) With regard to claim 3, claim 3 inherits all the limitations of claim 2. Higuchi et al. further discloses wherein the differentially coherent combing portion comprises a discriminator (Fig. 1 (S1200)) for deciding whether acquisition of the common short code is achieved or not from the outputs of the absolute value calculator.

Art Unit: 2634

6. Claims 4 and 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Higuchi et al. (6,167,037) in view of Masui et al. (US Patent 6,269,088) and further in view of Sriram et al. (US Patent 6,226,315).

Page 5

(1) With regard to claim 4, claim 4 inherits all the limitations of claim 1. Higuchi et al. in combination with Masui et al. discloses all the limitations of claim 1 above.

However Higuchi et al. in combination with Masui et al. do not disclose a switch for connecting each output of the long code masking correlation portion to output terminals which exist as many as the number of chips of the common short code, and repeating this process.

However Sriram et al. discloses a spread spectrum telephony with code acquisition comprising a switch for connecting each output of the long code masking correlation portion to output terminals which exist as many as the number of chips of the common short code, and repeating this process (Fig. 5, col. 7, lines 24-47, col. 8, lines 6-18).

Therefore it would have been obvious to one of ordinary skill in the art to modify the inventions of Higuchi et al. in combination with Masui et al. to incorporate a switch for connecting each output of the long code masking correlation portion to output terminals which exist as many as the number of chips of the common short code, and repeating this process in order to reuse one of the short codes as the long code group identification code.

(2) With regard to claim 5, claim 5 inherits all the limitations of claim 4. Higuchi et al. further discloses in (Fig. 5) wherein the long code masking correlation portion (12) is

Art Unit: 2634

a matched filter correlator comprising a plurality of taps whose tap coefficients are the common short codes generated internally (col. 10, lines 27-66).

## Allowable Subject Matter

7. Claim 6 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

#### Conclusion

- 8. The prior art made record of and not relied upon is considered pertinent to applicant's disclosure:
- a. Bottomley et al. US Patent 6005887 discloses despreading of direct sequence spread spectrum communications signals.
- b. Zhou et al. EP 0884856 A2 (cited by applicant) discloses a spread spectrum communication system.
- 9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Cicely Ware whose telephone number is 703-305-8326. The examiner can normally be reached on Monday Friday, 8-5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stephen Chin can be reached on 703-305-4714. The fax phone numbers for the organization where this application or proceeding is assigned are 703-872-9314 for regular communications and 703-872-9314 for After Final communications.
